USAGE & CASE STUDY GUIDE · JULY 2026

Built by **Cybrum Solutions** — One element. Every solution.

What This Project Is

Huzaifa Traders is a medical supplies distribution business — it buys bandages, syringes, gloves, IV sets, and similar items in bulk from factories and suppliers, and resells them to medical stores, pharmacies, and hospitals. Like most businesses at this stage, the day-to-day was running on registers, WhatsApp messages, and memory: who owes what, which supplier payment is due, how much stock is actually left.

Cybrum Solutions built **Huzaifa Traders a complete, purpose-fit business management system** — not a generic template, but software modeled directly on how this specific business actually works: two independent money flows (what they owe suppliers, what customers owe them), stock that updates itself from real transactions instead of manual counts, and a dashboard that surfaces exactly what needs attention today.

Admin Panel

Run the whole business — products, suppliers, customers, purchases, sales, and a live reporting dashboard.

Customer Portal

Every customer logs in to see their own invoices, balance, and payment status — no phone calls needed.

Public Website

A professional marketing site — what the business does, product catalog, and a route into the customer portal.

This document explains what was built, how to use every part of it, and exactly how much demo data is currently loaded so it can be explored risk-free before going live.

Two Money Flows, One Source of Truth

Every distribution business like Huzaifa Traders is really tracking two separate, independent ledgers at once. The system is built around this exact split:

01 – PURCHASE SIDE

What We Owe Suppliers

Stock comes in from suppliers on cash or credit. Credit purchases carry a credit period and a due date. When that date arrives, it surfaces on the dashboard as **"payment due to supplier."**

02 – SALES SIDE

What Customers Owe Us

Stock goes out to customers at a rate that can vary per customer, again cash or credit. The same due-date logic applies, surfacing as **"payment receivable from customer."**

03 – STOCK

Never Typed In By Hand

Stock quantity is a *derived number* — it only ever changes as a side effect of recording a real purchase (stock in) or a real sale (stock out). There is no "edit stock" button anywhere in the system, which means the number on screen can never drift from what actually happened. Every purchase or sale can list **multiple product line items** in one entry, exactly like a real supplier or customer invoice.

Why This Matters

- ✓ No more manually cross-checking a register against what's physically on the shelf.
- ✓ Nobody has to remember which supplier payment is coming up — the dashboard flags it automatically, every time it's opened.
- ✓ Customers stop calling to ask "how much do I owe you" — they can log in and see it themselves.
- ✓ Every rupee is traceable to a specific invoice and a specific line item, not a lump total.

The Admin Panel

This is where the business owner runs everything. Six modules, all tied together — a purchase or sale updates stock and the dashboard instantly, everywhere.

MODULE	WHAT IT DOES
Dashboard	Summary cards (stock value, total payable, total receivable, overdue count), 5 live charts (stock by category, 30-day purchase vs. sale trend, payable & receivable aging, top customers by balance), and two reminder widgets — payments due to suppliers, payments receivable from customers, both color-coded by urgency.
Products	Every product and its size/type variants (e.g. "Crepe Bandage — 6cm"), with category icons, search, sortable columns, and read-only stock per variant.
Suppliers	Factory/vendor records with contact details and a running count of purchases against each one.
Customers	Medical stores & hospitals the business supplies to. This is also where the admin creates a customer's portal login (email + temporary password) so they can access their own ledger.
Purchases	Multi-item purchase entry — pick a supplier, add as many line items as the invoice has, choose cash or credit (credit auto-calculates the due date), and record partial payments against it afterwards.
Sales	Same pattern for the sales side — rate can be set differently per line item, and the system blocks selling more stock than is actually available.

Every list — Products, Suppliers, Customers, Purchases, Sales — has a search box, click-to-sort column headers, and pagination, so the interface stays fast and usable as real data grows well beyond the current demo set.

Customer Portal & Public Website

02 — CUSTOMER PORTAL

Self-Service for Every Customer

Each customer with a portal login sees only their own data — a security rule enforced at every query, not just hidden in the interface. Their ledger shows:

- ✓ Every invoice (sale) ever issued to them, itemized, newest first
 - ✓ Total billed, total paid, and current balance owed — always up to date
 - ✓ A running balance so they can see how their account built up over time
 - ✓ Payment status per invoice — Paid, Partial, or Unpaid — with overdue dates flagged in red
 - ✓ A self-service "change password" screen
-

03 — PUBLIC WEBSITE

The Front Door

A marketing site for anyone who isn't logged in yet — built to look like a modern, trustworthy B2B platform, not a generic template:

- ✓ **Home** — a dark, confident hero section with an animated "Manufacturer → Huzaifa Traders → Medical Store / Hospital" supply-chain diagram as the visual centerpiece
- ✓ **Products** — the real product catalog, grouped by category, pulled live from the same database the admin uses (no prices or stock counts shown publicly)
- ✓ **About & Contact** — company story and a way to get in touch
- ✓ A persistent "**Customer Login**" route into the portal from every page

Technology Stack

Chosen for speed today and room to grow tomorrow — every piece is a current, actively-maintained, production-grade tool.

LAYER	TECHNOLOGY
Framework	Next.js 16 (App Router, Turbopack, Server Components + Server Actions)
Language	TypeScript, end to end
Database	PostgreSQL, hosted on Neon (serverless Postgres)
ORM	Prisma — type-safe database access, versioned migrations
Authentication	Auth.js — role-based access (Admin / Customer), route-level protection
Styling	Tailwind CSS v4, a shared design-token system (colors, type scale, spacing)
Charts	Recharts — the dashboard's live data visualizations
Icons	lucide-react — one consistent icon system throughout
Fonts	Space Grotesk, Inter, JetBrains Mono — loaded via <code>next/font</code> , self-hosted, no external font requests
Deployment target	Vercel — zero-downtime deploys, generous free tier for this phase

A note on data integrity: every purchase, sale, and stock update is wrapped in a single database transaction. If any part of an entry fails to save, none of it does — stock can never end up out of sync with the invoices that produced it.

Running the Business — Step by Step

DEMO LOGIN — ADMIN

Email: `admin@huzaifatraders.com` Password: `admin123`

STEP	ACTION
1	Sign in at <code>/login</code> . Admins land on the Dashboard automatically.
2	Check the dashboard first, every time — the "Payments Due" and "Payments Receivable" widgets show anything overdue or due within 3 days, sorted most urgent first.
3	Add a supplier or product once (Suppliers / Products) — everything after this reuses those records.
4	Record stock coming in: Purchases → New Purchase . Pick the supplier, add one line per item on the invoice, choose Cash or Credit. Credit asks for a credit period and auto-fills the due date.
5	Record stock going out the same way under Sales → New Sale — pick the customer, set a rate per line item (rates can differ by customer).
6	Stock updates immediately — check any product's variant to see the new total, no manual step required.
7	When a supplier or customer pays (in full or partially), open that purchase/sale and use Record Payment . Status updates automatically: Unpaid → Partial → Paid.
8	To give a customer portal access, edit them under Customers and set an email + temporary password — hand those to the customer to log in.

For a Medical Store or Hospital

DEMO LOGIN — CUSTOMER (any of the 3 below)

BUSINESS	EMAIL	PASSWORD
City Care Pharmacy	citycare@example.com	customer123
MediPlus Medical Store	mediplus@example.com	customer123
Shifa International Hospital	shifa@example.com	customer123

STEP	ACTION
1	Sign in at <code>/login</code> with the portal email — customers land on their Ledger automatically.
2	The top of the ledger shows three numbers at a glance: total billed, total paid, and current balance owed.
3	Below that is every invoice ever issued to this business — newest first, each with its own status badge (Paid / Partial / Unpaid) and due date.
4	Click "View" on any invoice to see the full itemized breakdown — products, quantities, rates, and every payment recorded against it.
5	An overdue invoice is highlighted in red so it can't be missed.
6	Use "Change Password" any time to update the login — no admin involvement needed.

A customer can only ever see their own invoices — this is enforced on the server for every single request, not just hidden by the interface. There is no way, by design, for one customer to view another's data.

Demo Data Snapshot

This is not a set of static mockups — it is a fully working system connected to a live PostgreSQL database, pre-loaded with realistic demo data so every screen, chart, and reminder can be explored exactly as it will look with real business data. Figures below reflect what is in the database at the time of writing.

9 Customers (clients)	6 Suppliers	6 Products
21 Product variants	18 Purchase invoices	18 Sale invoices
22 Payments recorded	3 Customer portal logins	4 Product categories

DATA SET	DETAIL
Customers	9 businesses — a mix of medical stores and hospitals (e.g. City Care Pharmacy, MediPlus Medical Store, Shifa International Hospital). 3 have an active portal login for the demo.
Product categories	Bandages, Syringes, Gloves, IV Sets — 6 products across 21 individually-tracked size/type variants.
Purchases & Sales	18 of each, a realistic mix of cash and credit, spread across recent weeks — including entries that are intentionally overdue and due-soon, so the dashboard reminders have real data to demonstrate against.
Stock	Every variant's stock is mathematically consistent — total purchased minus total sold, verified to never go negative.

Project Status & What's Next

- **Demo build complete** — ready for client review and walkthrough.

Delivered in this phase

- ✓ Full admin panel — products, suppliers, customers, purchases, sales
- ✓ Live reporting dashboard with 5 charts and automatic due-date reminders
- ✓ Customer self-service portal with secure, isolated data access
- ✓ Public marketing website with a real, live product catalog
- ✓ A complete visual design pass — design tokens, responsive layouts, loading states, accessible focus states and color contrast

Deliberately out of scope for this phase

Kept out on purpose to ship a focused, reviewable demo first — natural next steps once the core system is approved:

- ✓ WhatsApp / email delivery for payment reminders (currently in-app only)
- ✓ PDF invoice generation
- ✓ Payment gateway integration for online payments
- ✓ Multiple admin accounts with granular permissions
- ✓ Low-stock alerts

ONE ELEMENT. EVERY SOLUTION.

Built end to end by an AI-native company — architecture to deployment, one accountable team.

Cybrum Solutions builds intelligent automation, AI agents, chatbots, and full-stack web systems that run real business workflows — like the one in this document.
